Field Capture

Training Guide

For picking teams logging crates at a field station.

Getting started with your phone

Field devices are **Ulefone RugKing 4 Pro** phones — rugged, high battery capacity, built to last a full day in the field. When you're given your phone, or at the start of each day:

1. **Check the battery.** Make sure there's enough charge for a full day. Charge it fully overnight if it's low.
 2. **Unlock the phone.** Swipe up on the screen, then enter the code **1470**.
 3. **Check Tailscale is connected.** Open the **Tailscale** app and look for a **green dot** next to your device's name — that means it's connected to the farm's account (**bekfontein01**). Without this, nothing in the Harvest app will work (see "If something looks wrong" further down).
 4. **Open the app.** Tap the **Harvest Capture** icon on the home screen. (If your phone has just been set up again, the icon may be labelled **Field** instead — it's the same app.)
 5. **Check whose fruit you're picking.** Just under the station name at the top, the app says either "**Picking own fruit**" or "**Picking for ...**" with a grower's name. Read it once at the start of the day and make sure it matches where you actually are — see "Whose fruit this phone is picking" below for why it matters.
-

Whose fruit this phone is picking

Each phone is set up for one grower: either the farm's own fruit, or one of the other growers who send fruit to the pack house. The line at the top of the screen tells you which:

What it says	What it means
Picking own fruit	Everything logged on this phone counts as the farm's own harvest.
Picking for ... (a grower's name)	Everything logged on this phone is credited to that grower instead.

This is not something you can change on the phone, and you don't need to do anything about it — but it's worth a glance, because **every crate you save is credited to whoever that line names**. If it names the wrong grower, the day's picking ends up on the wrong account, and that's easier to catch now than to unpick later. Tell your supervisor.

The **Block** list follows the same setting. Blocks that belong to another grower are hidden, so a phone set up for one grower can't log crates against someone else's orchard by mistake. Blocks that haven't been given a grower at the office show on every phone — so if nothing has been set up that way yet, you'll simply see the full list as before, and nothing about your day changes.

The 5-step loop

This is everything you'll do, over and over, all day:

1. **Tap "Scan Worker QR"** and point the camera at the worker's badge.
2. **Choose the block** from the dropdown, if it isn't already selected.
3. **Type the weight** on the keypad.
4. **Tap "Save Crate."** You'll hear a chime and the crate count at the top of the screen goes up.
5. Repeat for the next crate.

When a truck is ready to take a load away, you send a **Picking Slip** (see below) — that's the only other thing you'll do.

Your screen, top to bottom

- **Top bar** — shows which station this device is, whose fruit it's picking (see above), and a coloured pill telling you whether it's connected: **green** = everything is sent, **amber** = sending right now, **red** = no connection. Don't worry if it's red — see "Working without signal" below.
- **Amber bar under the top** — only appears when there's no connection, and says so plainly. It disappears on its own when the signal is back.
- **Crates / kg card** — how many crates and total kg logged for the load currently being built at this station, plus how long it's been running.
- **Scan Worker QR button** — tap this before every crate.
- **Block** — which block this crate came from. Only blocks belonging to the grower named at the top appear here.
- **Weight keypad** — type the number, then tap the crate icon (delete button clears a mistyped digit).
- **Save Crate** — logs the crate. Do this every single time, even if you're in a rush — a crate that isn't saved doesn't count.
- **Send Picking Slip** — only tap this when a truck is actually leaving with the load.

Logging a crate, step by step

1. Scan the worker's badge. Tap **Scan Worker QR**. Point the camera steadily at the worker's printed badge until it beeps. The worker's name appears on screen once it's matched — check it's the right person before continuing.

If it says "**QR code doesn't match a known worker**," that badge isn't recognized. Don't guess — tell your supervisor so the office can check or reprint it. There's no way to type a worker in manually; it has to be a scan.

If it says "**Camera unavailable**," see "If something looks wrong" at the end of this guide — it's usually a quick fix you can do yourself.

2. Check the block. Make sure the block dropdown shows the block you're actually picking in. It usually stays the same all day at one station, but double-check it after a break or when moving to a new area.

The list only holds blocks belonging to the grower named at the top of the screen. If the block you're standing in isn't there, don't pick the nearest-looking one — see "If something looks wrong" at the end.

3. Weigh and enter the crate's weight. Use the on-screen keypad. The "." button is for decimals (e.g. 18.5), and the delete button (⌫) removes the last digit if you make a mistake.

4. Save the crate. Tap **Save Crate**. You'll hear a short chime and the crate count updates immediately. That's your confirmation it was logged — if you don't hear the chime or see the count change, try again.

5. Repeat. Scan the next worker for the next crate. You don't need to reselect the block unless it's changed.

Sending a Picking Slip (when the truck arrives)

When a truck is ready to take crates to the pack house:

1. Tap **Send Picking Slip**.
2. Enter how many crates are going **right now** — if the truck can't take everything you've logged, you can send fewer and keep the rest for the next truck (see "Splitting a load" below).
3. Enter the **driver's name**.
4. Tap **Send**.

A green "**Picking Slip Sent**" banner confirms it went through, and you'll see it added to "Dispatched today from this station" further down the screen.

Splitting a load

If you have more crates logged than the truck can carry, you can send just some of them — enter that smaller number of "crates going now" instead of the full count. This needs the device to actually be connected (not offline) at that moment, since the office's system has to work out exactly which crates are going. If you see a message about reconnecting to split the load, either wait a moment for the connection to come back, or send everything on this truck instead.

Working without signal

Out in the field, this device is often out of Wi-Fi/data range — that's completely normal and nothing breaks. Every crate you save is stored on the device itself first. As soon as the device gets a connection again (even briefly), everything you logged sends itself to the office automatically — you don't need to do anything.

The status at the top just tells you what's happening:

Status	Colour	What it means
Online - synced	Green	Everything is up to date with the office.
Syncing 3...	Amber	Sending your logged crates now.
Offline	Red	No connection right now — crates are still saving on the device, nothing is lost.
Offline - 3 pending	Red	Same, and 3 crates are waiting to be sent. The number goes down by itself once you're back in range.
Online - sync failed, retrying	Amber	Reached the office system but it wouldn't accept the last send — it keeps trying on its own.

You don't have to do anything about a red pill. Keep picking and keep saving crates: the number just tells you how many are still waiting.

Checking your own work

- **Recent crates** (lower on the screen) shows the last few crates you logged, so you can double-check nothing was missed.
- **Dispatched today from this station** shows every picking slip already sent today, with totals.

- **To refresh the screen**, drag down from the top and let go. A small spinner appears while it reloads. There's no need to do this normally — the screen keeps itself up to date — but it's there if you want to force it.
-

If something looks wrong

- **"Camera unavailable" when scanning, or the status won't move past "Offline" even though the phone has signal?** Check that **Tailscale** is running:

1. Open the **Tailscale** app on the phone (it's separate from this app, usually its own icon on the home screen).
2. It should say **"Connected."** If it says "Not connected" or similar, tap to reconnect, or sign in again if it asks you to.
3. Go back to this app and try again.

This device needs Tailscale connected to reach the office system at all — without it nothing will sync, even with full signal.

The scanner is fussier than the rest of the app: the phone's camera only works when this app is opened from the **secure address** Tailscale provides. That's why the camera can stop working while everything else still looks fine, and why reconnecting Tailscale usually brings it back. If the app says **"Scanning needs the secure address"**, or Tailscale shows Connected and the camera still won't start, that's one for your supervisor — it means this phone is opening the app from the wrong address, and only they can change it.

You can't log crates without scanning. There's no way to pick the worker by hand, on purpose — choosing the wrong name from a list is how a crate ends up paid to the wrong person. If the scanner won't work, stop and get your supervisor rather than guessing.

- **The block you're picking isn't in the list?** The list only shows blocks belonging to the grower named at the top of the screen, so either this phone is set up for the wrong grower, or that block hasn't been added to them at the office yet. **Don't log the crates against a different block** — the weights would be credited to the wrong orchard and, if the grower is wrong too, to the wrong account. Stop and tell your supervisor; it's a two-minute fix at the office.
- **The top of the screen names the wrong grower?** Same thing — tell your supervisor before you carry on picking. Everything logged in the meantime is credited to whoever is named there.
- **Logged the wrong weight or wrong worker on a crate that's already saved?** You can't fix this from the field device — tell your supervisor so the office can correct it.
- **Screen looks different / missing a button?** The app may need updating — tell your supervisor, don't try to fix it yourself.
- **Nothing happens when you tap Save Crate?** Make sure a weight is entered and a worker is selected first — both are needed before it'll save.
