Pack House Receiving

Training Guide

For staff at the pack house gate, checking in loads as trucks arrive.

What this screen does

Your screen shows every load that's been dispatched from the field and is on its way to you, oldest first. When a truck arrives, you find its load in the list, check what actually came in, and confirm receipt.

The top of the screen names **this pack house** above your station name (with its code alongside, once the office has entered one). You don't need to do anything with it — it's there so it's obvious which pack house you're checking fruit into.

Understanding the queue

Each load in the list is colored:

-  **Green** — recently dispatched, no rush.
-  **Yellow** — has been in transit a while, offload soon.
-  **Red** — has been waiting too long. **Offload red loads before green ones**, even if a green one arrived more recently — litchis lose quality fast once picked, and red means this load needs it most.

The list is already sorted oldest-first, so working from the top down is almost always the right order.

Each load also shows **which grower it belongs to**, in bold under the slip number — the farm's own fruit, or one of the growers who send fruit here. Loads from different growers sit in the same queue and are received exactly the same way; the name is there so the right fruit is credited to the right account, and so you can tell two similar loads apart when several trucks are waiting.

Under the grower you'll see the team and driver where there is one. An external delivery (below) has no team, so it just shows the driver.

Receiving a load, step by step

1. Find the load in the list — match it by driver name or slip number if several trucks are waiting.
2. Tap it to open the receiving form.
3. Check **Expected crates** (shown at the top) against what's actually on the truck, and type the real count into **Actual crates received**.
4. Tick the **Condition** that applies — Good, Damaged, Sunburn, Wet, or Other. You can tick more than one if needed.
5. Add any **Notes** if something's worth flagging (e.g. "2 crates crushed in transit").
6. Type your name in **Received by**.
7. Tap **Confirm Receipt**.

That's it — the load moves out of the queue and the office can see it as received.

If the actual count doesn't match what was expected

Just enter the real number you counted — don't adjust it to match the expected figure. The system automatically records the difference (a "discrepancy") so the office can see it; that's normal and expected when it happens, not something you need to fix or explain in the app itself.

Logging an external delivery

Use this when a truck arrives directly from a **grower who doesn't use our field devices** — their fruit was never "dispatched" through the app, so there's no existing load to find in the queue.

1. Tap **Log External Delivery** (top of the screen).
2. Choose the **Supplier**. Only growers other than the farm's own fruit appear here — a load off our own field devices is already in the queue and must never be logged twice.
3. Enter the **Crates** and **Total Kg** on the truck.
4. Enter the **Driver** name.
5. Add **Notes** if needed.
6. Tap **Add to In-transit**.

This adds it to the same queue as any other load — you'll then receive it the normal way (find it in the list, tap it, confirm receipt) once it's actually offloaded.

Working without signal

If the connection drops, an **amber bar** appears at the top and the list keeps showing the last queue it loaded, so you can still see what was on its way. The time at the top right changes to something like *"offline - last update 4 min ago"* — that's your reminder the list is a snapshot, not live. It refreshes itself once the connection is back.

Confirming a receipt does need the connection. If it can't get through you'll see *"Could not confirm - check connection and retry"* and nothing is saved — the load stays in the list. Check the load in again once you're back online. (Unlike the field devices, receipts are not stored up to send later, so don't assume it went through.)

If something looks wrong

- **A load you're expecting isn't in the list** — it may not have been dispatched yet from the field, or may already have been received by someone else. Check with the field station or the office before assuming something's broken.
- **A load shows the wrong grower** — receive it anyway if the truck is there and the fruit is real; don't hold up the offload. Then tell the office, because the fruit will be credited to the name shown until they correct it. It usually means the field phone that sent the load is set up for the wrong grower.
- **A grower is missing from the External Delivery list** — they either haven't been added at the office yet, or have been marked inactive. Don't log the delivery against a different grower to get it through; ask the office to add them.
- **Wrong crate count already confirmed?** You can't edit a receipt from this screen once it's submitted — tell the office so they can correct it.
- **Screen looks out of date** — tap the status pill, top right (it turns red when offline), or drag down from the top of the list and let go.
