BOORD

Admin

Training Guide

For farm office staff managing workers, wages, reports, and settings.

Opening the Admin app

There is no sign-in. Boord has one admin — you — so there is no username, no password, and nothing to forget. Open the Admin app and it is simply there.

What takes the place of a password is **where you open it from**. The Admin screens answer one thing only: a device connected to your Tailscale network, at the `https://...ts.net/` address. Anywhere else — the farm Wi-Fi, or even a browser on the office PC the server runs on — gets *"The Admin app is only reachable over Tailscale"*.

So the answer is always the same: make sure Tailscale says **Connected**, then open the `https://...ts.net/` address. There is no local shortcut and no fallback, on purpose.

That restriction is the point rather than an inconvenience: the pickers' and receiving tablets are on the farm Wi-Fi, and everything sensitive — worker contact details, the whole payroll — lives behind these screens. Their own Field and Pack House apps are unaffected and keep working on the Wi-Fi exactly as before.

The top bar shows the farm name, today's date/time, and current weather, and a **Labour** button that opens Boord Labour (the packhouse time clock) in a new tab. There are four tabs: **Dashboard**, **Payments**, **Reports**, **Settings**. On a phone they sit along the bottom of the screen, each an icon with its name under it; on a computer they run across the top, under the top bar. Master Data is inside **Settings**.

The first time: the setup wizard

On a brand-new server you will not see those tabs straight away. Boord shows a nine-step wizard instead, because a fresh install genuinely does not know whose farm it is — it has no name, no location, no blocks and no wage rate, and it will not invent any of them.

Work through it: farm name and supplier name, GPS (there is a map to click on), the rate you pay per kilogram, the transit thresholds, then your blocks, your people, your station names, and any past seasons you have records for. The first three are required. The rest have a **Skip for now** button, and the last screen tells you what is still outstanding.

If you have to stop, just close it. Next time you open the Admin app it picks up at the first step you have not done. When you press **Open Boord** on the last screen the wizard is finished with — everything on it lives under **Settings** and **Master Data** from then on.

You will not see this on a farm that is already running Boord.

Dashboard — your daily overview

This is where you check how the harvest is moving.

1. Set the **Farm/Supplier** filter (or leave it on "All") and a **Period start/end** date range — or just tap **Today**, **This Week**, or **Season** for a quick preset (whichever one matches the current dates stays highlighted). Everything below refreshes the moment any filter changes — there's no separate Refresh button.
2. The KPI cards along the top summarize the period: teams/workers/ blocks active, total kg and crates, averages, and a breakdown of Harvesting / In Transit / Received.
3. Below that, five expandable lists give the detail behind those numbers:

   • **Harvesting** — loads still being picked in the field.
   • **In Transit** — dispatched, not yet received at the pack house.
   • **Received** — already checked in; tap a row to open its crates.
   • **Workers** — per-worker totals for the period.
   • **Blocks** — per-block totals for the period, including yield per hectare.

Tap any list's header to expand or collapse it.

Harvesting and In Transit use the same green/yellow/red color coding as the Pack House screen — red means a load has been waiting too long and needs attention.

Correcting a captured crate

Tapping a row in the **Received** list opens that load's crates — time, block, worker, weight, deduction, and net kg — each with an **Edit** and a **Delete** link. Use this to fix a mistake made at capture time (wrong worker scanned, mistyped weight, wrong block): you can change the **Worker**, **Block**, **Weight (kg)**, and **Deduction (kg)** on that crate, or **Delete** a crate that should never have been logged (it asks first, and can't be undone). The lot's totals recalculate immediately everywhere they're shown. Delete a slip's last crate and the slip itself is removed too.

Pickers can fix their own mistakes before the load leaves: the field phone's **Undo last crate** takes back the most recent crates on the slip still being picked. Once the slip is sent, fixes come here.

If wages were already calculated for the affected period, a warning banner says so — re-run **Calculate Wages** in Payments for that period afterward, since a correction doesn't rewrite a wage sheet that's already been run.

Season analysis — in the Owner app, not here

This season against 2020–2025 history, the farm's weather record back to 1987, and the season risk score and harvest forecast are not part of the Admin app. They live in the separate **Boord Owner** app, which has its own link — ask whoever set it up.

Admin is for the day-to-day operational work: the Dashboard, Master Data, Payments, Reports and Settings.

The seasons before Boord went with it. This server keeps the harvest it has recorded itself — every crate, every load, every payment — and the Reports tab still exports all of it. What it no longer holds is the 1987–2019 history and the hourly weather record; those live in the Owner app now.

Master Data — the farm's reference information

Five subtabs: **Workers**, **Teams**, **Blocks**, **Devices**, **Suppliers**.

Adding a worker

1. Master Data → Workers → **Add Worker**.
2. Fill in Employee Number, First Name, Last Name, ID Number (SA ID or passport number), WhatsApp Number, and which Farm/Supplier they belong to (leave as "(none)" for your own farm's workers).
3. Optionally take or upload a **Photo** right there.
4. Make sure **Active** is ticked, then **Save**.

Printing worker badges

Workers scan a QR badge to identify themselves in the Field app — there's no other way to select a worker, so every active picker needs one.

1. Master Data → Workers.
2. Under **Print badges**, tap **Filtered** to print everyone currently shown in the table, **Selected** for just the ones you've ticked, or **All** for the whole list.

Badges come out 60 × 80 mm, nine to a page — cut along the dashed lines and each one fits an ID card holder as-is. **Check the print dialog's scale is 100%, not "Fit to page"**, or they'll print slightly too small to fit.

Reprint a badge any time a worker's is lost, damaged, or a new worker joins.

Teams, Blocks, Devices, Suppliers

- **Teams** — ID (e.g. "A"), name, induna. Add/edit with the same pattern as Workers.
- **Blocks** — each block's variety, tree count, hectares, and active/inactive. Use **Export** / **Import** (under **Spreadsheet**) to bulk-edit many blocks at once from a spreadsheet rather than one at a time. Tick **"Import replaces all"** before importing only when the file is meant to completely replace the block list (e.g. after re-dividing a block) — it retires any block not in the file instead of leaving it behind.
- **Devices** — every phone/tablet/PC that can access the app must be added here first, with its role (Field, Pack House, or Admin), station name, and team. A device shows "Unknown device id" until you've added it here.

- **Suppliers** — other farms that use your pack house, with their contact details and packing rate. Their loads stay separate from your own harvest everywhere in the Dashboard and Reports.

Payments — calculating wages

1. Payments tab.
2. Set the Farm/Supplier filter and date range (or Today/This Week/ Season).
3. Tap **Calculate Wages** to see each worker's kg and amount due for that period, based on the current rate.
4. Tap **Export Wage Sheet** to download it for payroll.

Reports — downloadable spreadsheets

1. Reports tab.
2. Set the date range and, if needed, a Farm/Supplier filter — **both dates must be filled in** or the report won't generate.
3. Tap the report you want. They are grouped under **Harvesting**, **Packhouse** and **Markets & Transport**; hold the pointer on one to read more about it. Each one downloads as an `.xlsx` file:

Report	What it contains
Daily Harvest Summary	Crates/kg by block and team for one day (always just the start date — a wider range gets flagged "Daily report only")
Lot & Receiving Report	Every load dispatched in the range, with receiving detail
Plukstrokies / Picking Notes	One row per dispatched load — block(s), crates sent vs. received, driver, condition, notes, weather
Span Pluklys / Team Picking List	One row per team per day, matching the paper picking slip — blocks picked and loads dispatched that day
Daaglikse Oesdata / Daily Harvest Data	Kg by block vs. date over a range, with block and day totals
Harvesting List	Loads still being picked
In Transit List	Dispatched but not yet received
Pakhuis Ontvangstes / Pack House Receivables	Already received loads, matching the paper receiving slip — date/time, block, and rejected kg included
Worker Harvest Report	Per-worker crates/kg/amount due
Lietsjie Lone / Litchi Wages	Per-worker crates harvested, one column per date worked, plus a total — a whole pay period on one row
Block Harvest Report	Per-block crates/kg/averages

Markets & Transport

The **Markets** tab lists the delivery notes that Boord Packhouse loaded between its two dates. It opens on the last week; tap **Season** to see them all.

1. When a market statement or a transporter's invoice arrives, find its note and tap **Enter** (or **Edit**).

2. For each pack, type the cartons sold and the price per carton. Then type the commission, deductions and bank cost. The form adds up the net for you.
3. Type the transporter's waybill number, the invoice number and the cost excluding VAT, then **Save**.

Notes still waiting for a statement show **Not entered**.

Emailed invoices fill themselves in. Once the farm Gmail is set up (see the manual), the Johannesburg market agents' invoices are read every 15 minutes. A note filled in that way shows an envelope next to its net paid, and its form lists the invoices instead of letting you type the sales. You still type the transport. When a new market product appears under **Market invoices by email** with an amber box, pick the Packhouse pack it is. You only do that once per product. **Fetch now** checks the email straight away.

The four market reports are on the Reports tab, under **Markets & Transport**, and use the Reports tab's dates:

Report	What it contains
Markte Opsomming / Market Summary	Per receiver and market: pallets, cartons sent and sold, gross, costs, net paid, R/carton, R/kg, transport, plus a total
Market Sales by Package Type	Per market and pack: sent, sold, average price
Consignment Sales	One row per delivery note: what went and what it paid
Vervoer Opsomming / Transport Summary	One row per note: transporter, waybill, invoice, pallets, R/pallet, cost excluding and including VAT, plus a total

---

Planner — the week's harvest plan

The **Planner** tab is the Monday whiteboard: what is left to pick per block, how much of it this week and on which days, and whether that covers the cartons the receivers want. Best on the office PC. It saves as you type.

1. Pick the **season** and the **week** (the arrows step a week; **This week** jumps to today's).
2. **Harvest this week:** every block is listed. **Tick the box in front of a block** to pick it this week (an unticked block is greyed and left out of the totals). Each shows the owner's estimate (from Boord Owner), what has been picked so far (YTD, up to last Sunday), last week, and what remains. **Available this week** starts at all that remains; change it as kg or %. Tick the **days** (M T W T F S S) the block is picked and the kg is shared over them. Type under a day to hold that day's figure (bold); the other days share the rest.
3. **Delivery this week:** type the **cartons** per receiver and pack. YTD and last week under each cell are from Packhouse's delivery notes. In the header, type once per pack how many of Packhouse's units make a carton (Pre-pac: 4 punnets, already set) and how many cartons make a pallet, so kg and pallets come out right. Pallets are whole and rounded up per receiver: a part-filled pallet still goes on the truck.
4. **Grand totals:** planned harvest, the juice-and-loss % (the season's own figure, or type one), what is deliverable after it, the planned delivery, and **Surplus** (green) or **Short** (red).
5. **Excel** or **PDF** downloads the whole week.

If the top of the page says Owner or Packhouse was not found, the plan still works without those figures — ask whoever looks after the server.

Settings

- **Data Backup** — **Backup Now** creates an immediate downloadable backup, always. One also happens automatically every night at 02:00, but only if the server is running at the time *and* something actually changed that day — on a quiet day nothing is written and no new row appears, which is normal. (After 30 days with no changes one is taken anyway.) Download backups regularly and keep a copy somewhere off the server — the last 14 are kept automatically, which protects against mistakes but not a hardware failure.
- **Farm settings** — farm name, location, current harvest season year, the green→yellow and yellow→red timing thresholds used for the color-coded queues, and GPS coordinates (enables the weather widget).
- **Harvest rate** — the current rate per kg used for wage calculations.

If something looks wrong

- **"Could not generate report" / a toast about picking dates first** — make sure both the start and end date are filled in before tapping a report.
- **A device shows "Unknown device id"** — it hasn't been added in Master Data → Devices yet; add it there first. Once added (and marked active) it appears in the dropdown on that device's setup screen as soon as the page is reloaded.
- **A screen shows an older version number than you expect** (top corner, e.g. "v1.1") — fully close and reopen the app (not just switch away from it) to pick up the latest update. Each screen updates separately, so do this on every device, not just one.
- **An amber "Offline" bar appears** — the screen can't reach the server. Whatever is on screen stays put rather than blanking out, and refreshes itself once the connection is back. A brief drop does not sign you out; only a genuinely expired session does, and that says so.
- **Anything else unexpected** — a full page refresh often clears minor glitches; if it persists, note exactly what you were doing and check with whoever manages the server.
